The program was created using a MacOS machine, hence there might be problems when the same code is run in different types of machines such as Windows or Linux. The group has recreated the same program in two separate MacOS machines with no problems but Windows encountered some few errors with regards to running the code. Rest assured, the errors experienced by said Windows machines were due to technical difficulties in allowing permission for the CSV file, and not errors in the actual code.

The group has no Linux user and hence we have not run the program on that type of machine yet. For Linux users who wish to run the code, there might be additional installations or even possible technical difficulties that may need further research.

For MacOS users, here are the specific steps that you can take to run the program:

1. Install CMake

2. Allow CMake to be run in your terminal

3. Install symlinks to your /usr/local/bin

4. Install the "requirements.txt" file

5. Run the python file
